Product Description

The fischer cleaning brush set, consisting of Ø20/30 mm brushes, enables the cleaning of drill holes in masonry to be carried out in an approval-compliant manner. High-quality, durable design made from metal with a wooden handle.

Advantages

- The steel brushes BS with stainless steel bristles are approved for cleaning drill holes in concrete and masonry.
- Brushes can either be used automatically or manually using the attached handle, depending on the cleaning procedure required.
- Note: Before use, check whether the brushes still have the required diameter. They must generate a noticeable resistance when being inserted into the drill hole. Brushes that are too small must no longer be used.
